

## Session 6 - Anchor Tag

`<a></a>` -> Anchor Tag -> The tag that helps us connect two pages to each other by using "href" ( hyperText Reference ) attribute.

```
<!DOCTYPE html>

<html>
<head>
    <title></title>
</head>
<body>

    <!-- ===== Ordered List ===== -->
    <!-- by this anchor tag we can link this html page to another page -->
    <a href="NewPage.html"> New Page </a>
    <!-- Ordered List -->
    <ol>
        <li>Apple</li>

        
        <!-- src , width , height are called the Attributes of a tag -->
        <hr>
        <li>Banana</li>
        
        <!-- the "alt" attribute specifies an alternative text for an
image -->
        <hr>
        <li>Orange</li>

    </ol>

</body>
</html>
```

#Now we make another HTML file named "NewPage.html" due to the name we have given to our "href" attribute.

```
<!DOCTYPE html>
<html>
<head>
  <title>New Page</title>
</head>
<body>
<p>This is the New Page</p>
<!-- we can make a paragraph or a header as an anchor tag
-->
<a href="HTML5 Tutorial1.html"><p>Go Back</p></a>
</body>
</html>
```
